

# Exercise: Calculating profit and margin

## Introduction

By now, you should be more familiar with formulas and calculations in Microsoft Excel. You have learned how to create and control a variety of different calculations. In this exercise, you will put this knowledge into practice by creating calculations to work out typical business results such as costs, revenue, profit and profit margin.

## Case study

Aimee at Adventure Works has asked you to help her prepare an Excel file that she will present at a management team financial review meeting. The worksheet tracks the items sold by one of Adventure Work's divisions. The file needs to contain results such as costs, revenue, and profit. Your task is to create the formulas and calculations for this sheet.
